

BANKING MANAGEMENT SYSTEM

PROJECT TITLE

Console-Based Banking Management System

OBJECTIVE

The objective of this project is to design and develop a Banking Management System that enables efficient management of customer accounts and banking transactions. The system provides functionalities such as account creation, customer management, deposits, withdrawals, fund transfers, and transaction history maintenance using Java, JDBC, and MySQL.

TECHNOLOGIES USED

- Java
- JDBC
- MySQL Database
- IntelliJ IDEA
- Object-Oriented Programming

PROJECT DESCRIPTION

The Banking Management System is a console-based application developed using Java and MySQL. The system allows users to perform various banking operations through a menu-driven interface. Customer and account information are stored securely in a MySQL database and accessed using JDBC connectivity.

The application supports customer registration, account creation, deposits, withdrawals, fund transfers, and transaction history tracking. Unique client IDs and account numbers are generated automatically to ensure proper account management. The project demonstrates the practical implementation of Java programming, database management, and Object-Oriented Programming concepts in a real-world banking scenario.

FEATURES

- Create Customer Account
- View Customer Details
- View Account Details
- Display All Customers
- Display All Accounts
- Deposit Money
- Withdraw Money
- Transfer Money
- Transaction History Tracking
- Random ID and Account Number Generation

DATABASE DESIGN

The Banking Management System uses MySQL as its backend database. The database is designed to store customer information, account details, savings account information, and transaction records.

DATABASE NAME: banking_system

Table 1: clients

Stores customer information.

Column Name	Data Type	Description
client_id	VARCHAR(20)	Unique Client ID (Primary Key)
name	VARCHAR(100)	Customer Name
address	VARCHAR(200)	Customer Address

Table 2: accounts

Stores account information.

Column Name	Data Type	Description
account_number	BIGINT	Account Number (Primary Key)
balance	DOUBLE	Current Account Balance
client_id	VARCHAR(20)	Customer ID (Foreign Key)
transaction_date	TIMESTAMP	Account Creation Date

Relationship:

- One Client can have one or more Accounts.
- client_id references clients(client_id).

Table 3: savings

Stores savings account information.

Column Name	Data Type	Description
account_number	BIGINT	Savings Account Number
interest_rate	DOUBLE	Interest Rate

Relationship:

- account_number references accounts(account_number).

Table 4: transactions

Stores all banking transactions.

Column Name	Data Type	Description
transaction_id	BIGINT	Unique Transaction ID
account_number	BIGINT	Account Number
transaction_type	ENUM	DEBIT, CREDIT, TRANSFER
amount	DECIMAL(15,2)	Transaction Amount
balance_after_transaction	DECIMAL(15,2)	Remaining Balance
transaction_time	TIMESTAMP	Transaction Time

Relationship:

- account_number references accounts(account_number).

DATABASE SCRIPT SCREENSHOT:

```
1 • use banking_system;
2 • CREATE TABLE clients
3   (
4     client_id VARCHAR(20) PRIMARY KEY,
5     name VARCHAR(100) NOT NULL,
6     address VARCHAR(200) NOT NULL
7   );
8 • CREATE TABLE accounts
9   (
10    account_number BIGINT PRIMARY KEY,
11    balance DOUBLE DEFAULT 0,
12    client_id VARCHAR(20),
13    transaction_date TIMESTAMP,
14    FOREIGN KEY(client_id)
15    REFERENCES clients(client_id)
16  );
17
18 • CREATE TABLE savings
19   (
20    account_number BIGINT PRIMARY KEY,
21    interest_rate DOUBLE,
22    FOREIGN KEY(account_number)

DATABASE TABLE SCREENSHOT

CODE SNIPPETS

DATABASE CONNECTION

```
1  import java.sql.*;
2
3  public class DBConnection { 16 usages  Devabisheik
4      public static Connection getConnection() throws SQLException { 16 usages  Devabisheik
5          String url = "jdbc:mysql://localhost:3306/banking_system";
6          String user = "root";
7          String password = "Abi@2007";
8          Connection con = DriverManager.getConnection(url, user, password);
9          return con;
10     }
11 }
12
```

ACCOUNT CREATION

```
private static void createAccount() throws SQLException { 1 usage  Devabisheik
    scan.nextLine();
    System.out.print("Enter Your Name: ");
    String name = scan.nextLine();
    System.out.print("Enter Your Address: ");
    String address = scan.nextLine();
    String clientID = IDGenerator.generateID();
    long accNumber = IDGenerator.generateAccountNumber();
    System.out.print("Enter Initial Balance: ");
    double balance = scan.nextDouble();
    Client client = new Client(clientID, name, address);
    Account account = new Account(accNumber, client);
    account.balance = balance;
    ClientDAO.addClient(clientID, name, address);
    AccountsDAO.addAccount(clientID, accNumber, balance);
    System.out.println("\n==== ACCOUNT CREATED SUCCESSFULLY =====");
    System.out.println("Client ID      : " + clientID);
    System.out.println("Account Number : " + accNumber);
}
```

DEPOSIT MONEY:

```
public void deposit(long accNumber, double amount) { 1 usage  @Devabisheik
    try {
        double balance = AccountsDAO.getBalance(accNumber);
        BankServiceDAO.deposit_money(accNumber, amount);
        Transaction.addDetails(accNumber, amount, balanceAmount: balance+amount, type: "CREDIT");
        System.out.printf("Amount: %.2f was deposited to Account: %d\n", amount, accNumber);
    } catch (SQLException e) {
        System.out.println("Database Error: " + e.getMessage());
    }
}
```

WITHDRAW MONEY:

```
public void withdraw(long accNumber, double amount) { 1 usage  @Devabisheik
    try {
        double balance = AccountsDAO.getBalance(accNumber);
        BankServiceDAO.withdraw_money(accNumber, amount);
        Transaction.addDetails(accNumber, amount, balanceAmount: balance-amount, type: "DEBIT");
        System.out.printf("Amount: %.2f was withdrawn from Account: %d\n", amount, accNumber);
    } catch (SQLException e) {
        System.out.println("Database Error: " + e.getMessage());
    }
}
```

TRANSFER MONEY

```
public void transfer(long fromAcc, long toAcc, double amount) { 1 usage  @Devabisheik
    try {
        double fromBalance = AccountsDAO.getBalance(fromAcc);
        double toBalance = AccountsDAO.getBalance(toAcc);
        BankServiceDAO.transfer(fromAcc, toAcc, amount);
        Transaction.addDetails(fromAcc, amount, balanceAmount: fromBalance-amount, type: "TRANSFER");
        Transaction.addDetails(toAcc, amount, balanceAmount: toBalance+amount, type: "TRANSFER");
    } catch (SQLException e) {
        System.out.println("Database Error: " + e.getMessage());
    }
}
```

RESULTS

The Banking Management System was successfully developed using Java, JDBC, and MySQL. The application was tested with different banking operations, and all functionalities worked as expected. Customer details and account information were stored and retrieved successfully from the database. The system was able to perform deposits, withdrawals, fund transfers, and transaction tracking accurately. The integration between Java and MySQL through JDBC was implemented successfully, ensuring reliable data management.

CONCLUSION

The Banking Management System provides an efficient way to manage customer accounts and banking transactions. Through this project, Java programming, Object-Oriented Programming concepts, JDBC connectivity, and MySQL database management were applied in a practical scenario. The project successfully demonstrates how software can be used to automate banking operations and maintain transaction records efficiently.
